

YASH HEMNANI

Senior Backend & Platform Engineer · AI Developer Platforms

yashh.1402@gmail.com · +91 89628-60972 · [linkedin.com/in/yash-hemnani](https://www.linkedin.com/in/yash-hemnani) · github.com/yashh1402

SUMMARY

Backend/platform engineer with 8 years building fintech and SaaS systems on Node.js/TypeScript, Python and AWS. Currently own platform engineering and the AI developer platform at a Series A fintech — internal developer portal, multi-channel notification, and org-wide AI tooling for the dev loop. Strong on event-driven architecture, cost optimization, and shipping LLM features to production.

SKILLS

Languages & Frameworks: TypeScript, Node.js, NestJS, Python

Platform & Infra: AWS (ECS, Lambda, VPC, SQS, SES, Cognito), Docker, Kafka, GitHub Actions, Backstage, OpenTelemetry/Grafana, Sentry

AI Engineering: LLM workflow orchestration, agent & skill design (Claude Code, Codex), AI code review in CI, context/token-cost budgeting, evals, model gateways

Data & Messaging: PostgreSQL, DynamoDB, Redis, Kafka, SQS

Practices: Event-driven architecture, golden-path templating, CI/CD migration, CODEOWNERS/ownership models, security hardening

EXPERIENCE

Senior Engineer — Platform & AI — Alaan (Series A fintech, UAE)

Bengaluru · May 2025 – Present

Platform team owning developer experience, notification infra and AI tooling across a 90+ repo, 30+ service fleet.

- **Built the org's AI developer platform:** 10+ plugin packs (skills, agents, hooks) for Claude Code/Codex, distributed to every service repo via automated config-sync. Includes AI code review in CI, PM/Tech-Lead persona agents, and a dev-flow orchestrator (plan → review → ticket → branch → PR). Added token-budget linting to cap always-on context cost per repo.
- **Led org-wide AI consolidation:** audited overlapping AI tooling across 90+ repos and defined a single source of truth per plane (model access, agent execution, config distribution, registry). Designed a LiteLLM gateway for centralized dev/CI model access with per-tenant spend tracking.
- **Stood up the Internal Developer Platform (Backstage):** fleet scorecard for 30+ repos, CI/CD health and trend views, per-environment deploy state across 10+ ECS clusters and Cloud Run, Grafana/Sentry/on-call surfaced on entity pages.
- **Architected the multi-channel notification platform:** Kafka-based dispatch across email, SMS, WhatsApp, push, IVR and in-app — 2M+ sends and 4M+ provider webhook events per month, 40K+ duplicate webhooks deduplicated. Built template-manager with versioning, recipient-health scoring, and channel-group preference enforcement at the dispatch chokepoint.
- **Drove service modernization (golden path):** migrated legacy services to the org NestJS template — staged Dockerfiles, Jenkins → GitHub Actions, CODEOWNERS, reverse-merge automation, artifact-contents CI assertions.
- **Security hardening:** surfaced and remediated an unauthenticated cross-tenant financial write path and unauthenticated provider delivery webhooks.
- **Disaster recovery:** on the DR response team during the March 2026 regional incident affecting UAE operations — supported failover to DR environments and continuity of production fintech workloads.

Technology Lead — WeCP

Bengaluru · Sept 2023 – Mar 2025

- Shipped AI-based candidate evaluation (Node.js + LLM/Whisper APIs), cutting evaluation time 40% and reducing scorer bias.
- Architected async large-data computation services (Node.js, SQS, ECS, DynamoDB, PostgreSQL, SES), automating 95% of manual exports.
- Integrated 5+ ATS platforms via APIs to streamline client workflows and accelerate enterprise deal closures.

Lead Software Engineer — WeCP

Bengaluru · Mar 2021 – Aug 2023

- Built automated billing pipeline (Node.js, Lambda, SQS, DynamoDB, Stripe), reducing CSM/Finance manual effort by 80%.
- Rebuilt image processing as a DeepFace + AWS Rekognition hybrid (Python/Flask), cutting cost 70% and improving throughput.

Software Developer → Senior Software Engineer — WeCP

Bengaluru · Nov 2018 – Feb 2021

- Core backend development on the assessment platform (Node.js, Angular, AWS), owning features from design to production.
